Assignment 3

Business Model Canvas

Centralized Health Platform

Student Names:	Fatima Abbas	(F2024077003)
	Sheeman Butt	(S2024266237)
	Umaina Mahmood	(F2024077021)
	Umair Tahir	(F2022376034)
	Zohaib Khalid	(F2022376005)
Course:	Innovation and Entrepreneurship (MG224)	
Instructor:	Ayesha Qayyum	
Section:	C10	
Semester:	Spring 2026	

Our Business Idea

Business Name: Centralized Health Platform

Type: Digital Health Platform (Mobile App + Web Portal)

Pakistan is facing a serious healthcare crisis. The government spends less than 1% of GDP on public health while the population has crossed 240 million. There is only one doctor for every 750,000 people and most of them are in big cities like Lahore and Karachi. About 60% of Pakistan lives in smaller cities and rural areas where getting to a specialist is very difficult.

Our solution is the Centralized Health Platform, a single digital app that combines four services patients need: online doctor consultations (telemedicine), electronic health records (EHR) so every patient has one permanent digital medical file, e-pharmacy so prescriptions are filled and delivered to the door, and lab test booking so patients can schedule tests online and get results digitally.

Unlike our competitors, Sehat Kahani, Oladoc, Marham, and CureMD, who each offer only one of these services, we bring everything together in one place. We are targeting Pakistan's 152 million broadband subscribers and approximately 381,000 PMDC-registered doctors. We need PKR 40 million to build and launch the platform and expect to break even between Month 10 and 14 after launch.

Business Model Canvas

The Business Model Canvas breaks down how a business works into 9 key areas. Each section below has been filled for the Centralized Health Platform, with an explanation of why that answer was chosen.

1. Customer Segments

Type: Multi-Sided Platform + Segmented

- **Patients:** Urban middle-class patients (18-45) who want convenient digital healthcare. Rural patients who cannot access specialists nearby. Chronic disease patients (diabetes, hypertension) needing regular monthly consultations.
- **Doctors:** PMDC-registered general physicians, psychiatrists, and dermatologists, specialties best suited for online consultations.
- **B2B Clients:** Hospital administrators and clinic owners who want to use our EHR system to manage their practice digitally.

Explanation: We chose Multi-Sided Platform because our business only works if both patients AND doctors are on it at the same time, one without the other makes the platform useless. We also segmented customers because rural patients, chronic patients, and B2B clients have different needs and require different approaches to reach them.

2. Value Propositions

Type: Accessibility + Cost Reduction + Convenience + Getting the Job Done

- **Accessibility:** People in rural areas can now consult a specialist from their phone, something not possible before without hours of travel to a big city.
- **Cost Reduction:** A private clinic visit costs PKR 1,500-3,000. Our consultations cost PKR 300-800, saving patients significant money every time.
- **Convenience:** Patients consult a doctor, get a prescription, and order medicine all from one app. Doctors manage their entire practice from one dashboard.
- **Getting the Job Done:** We directly solve Pakistan having only 1 doctor per 750,000 people by connecting patients to doctors digitally, regardless of location.

Explanation: These four propositions address the real problems our customers face. Accessibility solves the rural healthcare gap. Cost Reduction makes healthcare affordable in a country with high inflation. Convenience removes friction for patients and doctors. Getting the Job Done captures the core mission. We skipped Newness and Performance because telemedicine already exists in Pakistan, our edge is integration, not novelty.

3. Channels

Type: Web Sales + Direct Sales Force

- **App Stores and Website:** Patients and doctors download the app from Google Play Store or Apple App Store, or register on our website. This is the main channel for individual users.

- **Direct Sales Team:** For hospitals and clinics, a dedicated B2B sales team contacts decision makers, runs demos, and signs monthly contracts for the EHR system.

Explanation: We chose Web Sales because our product is digital, it does not need physical stores or shelf space. App stores are where our target users already look for services. We added a Sales Force for B2B because hospital deals require in-person meetings and trust-building, which cannot be done through an app download alone. We skipped Partner Stores and Wholesalers as they apply to physical product businesses.

4. Customer Relationships

Type: Personal Assistance + Automated Services + Self-Service

- **Personal Assistance:** 24/7 in-app customer support for patients and doctors to resolve technical issues, reschedule appointments, or get help with prescriptions.

- **Automated Services:** The app automatically sends appointment reminders, prescription refill alerts, and lab result notifications, no human involvement needed for each interaction.

- **Self-Service:** Patients manage their own health records, view past consultations, and book new appointments independently through the app.

Explanation: Personal Assistance is needed because healthcare is sensitive, patients need to feel supported and trust the platform. Automated Services keep users engaged without requiring a large support team, keeping costs low. Self-Service gives patients control over their health data, which builds confidence in the platform. We skipped Co-Creation as our platform does not rely on user-generated content.

5. Revenue Streams

Type: Usage Fee + Subscription Fees

- **Consultation Commission:** We take a 15% commission every time a patient books a consultation. If a session costs PKR 600, we earn PKR 90.

- **Pharmacy and Lab Commission:** We earn 10-15% on every medicine order and 10% on every lab test booked through our platform.

- **Doctor Subscriptions:** After 3 free months, doctors pay PKR 2,000-5,000 per month for practice management tools.

- **B2B Hospital Contracts:** Hospitals and clinics pay PKR 15,000-100,000 per month for the EHR system, our most stable, high-margin revenue stream.

Explanation: Usage Fees grow proportionally with consultations, the more activity, the more we earn. Subscription Fees from doctors and hospitals give predictable monthly income that does not depend on patient volumes. This combination makes the business financially resilient. We skipped Asset Sale and Licensing as we do not sell physical products or license our software to run independently outside our platform.

6. Key Resources

Type: Intellectual + Human + Financial

- **The Platform:** The app, website, and patient health data stored securely in our system. This is our most valuable asset, it took PKR 12M and 8 months to build.

- **PMDC Compliance Certification:** Our legal right to operate as a healthcare platform in Pakistan. Without PMDC compliance, we cannot onboard doctors or run consultations legally.

- **Founding Team:** CEO for strategy, CTO for technology, COO for operations, Medical Director for clinical quality, and a Marketing Head for growth.

- **PKR 40M Seed Funding:** From founders (PKR 20M), seed investors (PKR 15M), and government grant (PKR 5M). This covers all startup costs before revenue begins.

Explanation: Intellectual resources are our most important asset, the platform and certifications are what make the business possible and hard to copy quickly. Human resources are critical because healthcare needs both technical and clinical expertise. Financial resources are the fuel that takes us from idea to live product. We skipped Physical Resources because our business is digital and does not require factories or warehouses.

7. Key Activities

Type: Problem Solving + Platform Management

- **Platform Development and Maintenance:** The tech team continuously builds new features, fixes bugs, ensures data security, and keeps the app running smoothly 24/7.

- **Doctor Onboarding and Verification:** Every doctor must be verified against the PMDC register before seeing patients. This is a daily activity involving the operations team.

- **Patient Acquisition:** Running digital marketing campaigns on social media, referral programs, and partnerships with pharmacies and labs to bring new patients onto the platform.

- **Clinical Quality Management:** The Medical Director monitors consultation quality, handles complaints, and ensures all interactions meet PMDC standards.

Explanation: Platform maintenance is the most critical activity because a healthcare app that goes down or has a security breach can put patients at risk and destroy trust immediately. Doctor onboarding is what makes the platform valuable, without verified doctors, patients have no reason to use it. Patient acquisition drives revenue growth. We skipped Production because we do not manufacture anything physical.

8. Key Partnerships

Type: Strategic Alliances + Buyer-Supplier

- **Partner Pharmacies:** Fazal Din's, D-Watson, and other pharmacy chains fulfill digital prescriptions issued on our platform and deliver medicines to patients.

- **Diagnostic Labs:** Partner labs receive bookings through our app, conduct tests, and upload results directly into the patient's health record.

- **PMDC and Medical Associations:** These bodies help us reach and onboard doctors at scale and give the platform institutional credibility that marketing alone cannot achieve.

- **Telecom Companies:** Partnerships with Jazz and Zong can help us reach rural users through zero-rating deals making our app free to access without using mobile data.

Explanation: Pharmacy and lab partnerships complete the patient journey on our platform, without them, patients would have to leave the app to get medicines or book tests. PMDC partnerships speed up doctor onboarding and build trust. Telecom partnerships directly solve our biggest challenge: reaching rural Pakistanis who have basic mobile internet but may not actively seek health apps. We skipped Coopetition as we are not partnering with direct competitors at this stage.

9. Cost Structure

Type: Value-Driven with Cost-Driven elements

- **One-Time Startup Cost:** PKR 40,000,000, Platform development PKR 12M, Cloud and APIs PKR 5.6M, Cybersecurity and Legal PKR 5.1M, Office and Operations PKR 7.2M, Marketing and Onboarding PKR 10.1M.

- **Fixed Monthly Costs:** PKR 2,500,000 per month, Developer salaries PKR 900K, Cloud hosting PKR 350K, Customer support PKR 300K, Marketing PKR 500K, Rent PKR 200K, Legal retainer PKR 150K, Misc PKR 100K.

- **Variable Costs:** Customer support staffing, pharmacy delivery costs, and marketing spend all increase as the user base grows.

- **Economies of Scale:** As more users join, fixed costs stay the same but revenue grows, meaning the cost per user drops and profit margins improve over time.

Explanation: Our platform is primarily value-driven because we prioritize building a high-quality,

secure, and trustworthy healthcare product. However, we also incorporate cost-driven thinking by keeping consultation prices low (PKR 300-800) to make the platform accessible to average Pakistanis. Economies of Scale are a key part of our long-term strategy, the more users we have, the cheaper it becomes to serve each one, which is why reaching 8 million users in Years 1-3 is critical to our financial model.

BMC Quick Summary

Section	Summary
1. Customer Segments	Patients (urban, rural, chronic), Doctors (GPs, psychiatrists, dermatologists), Hospital B2B clients
2. Value Propositions	Accessibility (rural care), Cost Reduction (PKR 300-800 vs 1,500-3,000), Convenience (one app), Getting the Job Done
3. Channels	App Stores and Website for consumers. Direct Sales Force for B2B hospital and clinic contracts.
4. Customer Relationships	24/7 Personal Support, Automated reminders and alerts, Self-Service health record management
5. Revenue Streams	15% consultation commission, 10-15% pharmacy/lab commission, Doctor subscriptions PKR 2,000-5,000/month, B2B contracts PKR 15,000-100,000/month
6. Key Resources	Platform + PMDC certification (Intellectual), Founding team (Human), PKR 40M seed funding (Financial)
7. Key Activities	Platform development and maintenance, Doctor onboarding and verification, Patient acquisition, Clinical quality management
8. Key Partnerships	Partner pharmacies (Fazal Din's, D-Watson), Diagnostic labs, PMDC and medical associations, Telecom companies (Jazz, Zong)
9. Cost Structure	Startup: PKR 40M. Monthly fixed costs: PKR 2.5M. Value-driven with economies of scale as the user base grows.
